Textile Manufacturing Process:

Clothing is the basic human need. For hiding shame and also protecting from the inclemency of **weather clothing** is essential for human being. Clothing is the final product of textile manufacturing. Textile manufacturing or production is a very complex process. The range of textile manufacturing is so long. It starts from fiber to finished products. Flow chart of textile manufacturing is given below:

Fig: Textile manufacturing process

In most textile mills, the exact route changes slightly with fiber type, fabric construction, and end use, but the basic sequence stays the same.

Garments Manufacturing

This is the basic and primary flowchart of textile manufacturing. In this article I will give flow chart of all branches of textile engineering like as spinning, weaving, dyeing, printing, finishing and garment manufacturing.

In actual production, some routes branch early into woven, knitted, or garment dyed products, so the order is not identical for every product.

↓

Bailing

↓

Deliver

Finishing may be mechanical, chemical, or a mix of both. In practice, stentering controls width, compacting helps reduce shrinkage, and final inspection catches surface faults before packing.

Dispatch

The exact sequence changes by product, but the logic is constant: prepare the material, build the yarn or fabric, apply color and finish, then inspect before shipment.

Frequently Asked Questions (FAQs)

Q1. What are the main steps in textile manufacturing?

Ans: The main steps are spinning, weaving or knitting, dyeing or printing, finishing, and **garment manufacturing**. The exact route depends on whether the end product is yarn, fabric, or ready made clothing.

Q5. Is mercerizing necessary in textile processing?

Ans: No, mercerizing is not necessary for every fabric. It is mainly used for cotton when better luster, strength, and dye affinity are required.

Q4. What is the difference between dyeing and printing in textile manufacturing?

Ans: Dyeing gives color to the whole fabric or yarn, while printing applies color in a pattern or design. Both use similar pretreatment, but the color application and finishing controls are different.
